

CARLISLE'S AUTHORIZED APPLICATORS MARKETING ANNOUNCEMENT

EPDM-2013-07
New & Improved Aqua Base
May 21, 2013

To: Carlisle SynTec Systems' Authorized Applicators

Carlisle SynTec Systems is pleased to announce a new and improved formula for Aqua Base 120 Bonding Adhesive.

The new formula features improved long-term heat aging performance, allowing for use in warranties up to 20 years. The new Aqua Base will maintain its adhesive properties similar to our time-tested products **90-8-30A and TPO Bonding Adhesive**.

Another innovative new feature makes the product more user friendly during installation; the adhesive changes color as it flashes off, indicating when the membrane can be installed. The new Aqua Base adhesive is pink in color when it is first applied to the surface and dries to a light yellow color when the water has flashed-off. This is a significant advantage when using the product as a two-sided contact adhesive with either EPDM or TPO membranes, since it eliminates guesswork on the roof. When using the product for FleeceBACK installations with a wet lay-in process, the adhesive should still be pink in color prior to setting the sheet.

The part number and stocking locations have remained the same as listed below:

<u>Part #</u>	<u>Description</u>	<u>Size</u>	<u>Stocking Location</u>
307431	Aqua Base 120	5 gallon pails	Carlisle, Greenville, Senatobia, and Tooele

UL and FM Code Approvals are available with the new formula when used as a contact adhesive. Coverage rate, approved substrates, application temperatures and pricing remain the same. Aqua Base is one of several low VOC options for adhered systems.

The inventory in all locations has been converted to the new formula and is available for immediate shipment.

Sincerely,

Ronald L. Goodman
Marketing Manager – EPDM and FleeceBACK Systems
